A cDNA clone (716065) coding for an Ikaros protein (R92020) has been identified. Transgenic animals, pref. mice, having a mutated Ikaros transgene, esp. a mutation that alters the DNA binding domain of the Ikaros protein, are used as models to determine the effects of treatments for immune or nervous system

Por System or corpus striatum

Por System or corpus striatum

Por Discloaure; Column 51-56; Illpp; English.

Co the following properties; (a) it stimulates transcription of a DNA sequence under the control of a delta A element, an NFNB element or an Ikaros binding oligonucleotide consensus sequence; (b) it binds to any of a delta A element, an NFNB element or an Ikaros binding oligonucleotide consensus sequence; (c) it competitively inhibits the binding of a naturally occurring Ikaros isoform to any of a delta A element, an NFNB element or an Ikaros binding oligonucleotide consensus sequence; (d) it competitively inhibits Ikaros binding to Ikaros responsive elements; or (e) it inhibits protein-protein interactions of transcriptional complexes formed with naturally occurring Ikaros isoforms. The proteins, provided that they stimulate gene transcription under the control of delta A elements and/or Ikaros-binding oligonucleotides, competitively inhibit Ikaros binding to Ikaros-binding oligonucleotides, competitively inhibit Ikaros binding to Ikaros-binding oligonucleotides, competitively inhibit Ikaros binding to Ikaros-binding oligonucleotides, competitively inhibit Ikaros binding to Ikaros-responsive elements and/or inhibit protein interactions of transcriptional complexes with naturally occurring Ikaros isoforms, can be used to treat immune system of allohibate protein interactions of transcriptional complexes with naturally occurring Ikaros isoforms, can be used to treat immune system of allohibate protein protein protein protein at AlDS, or corpus striatum disorders, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ώ

CONA clones (T16059 and T16061-64) encode different isoforms, mik-2, mik-3, mik-1, mik-4 and mik-5 (R92014 and R92016-19, respectively), of the mouse Ikaros protein, a master regulator of hematopoietic differentiation. They were isolated from a mature T-cell line E-14 cDNA library. The isoforms arise by differential splicing of the Ikaros genomic locus. All include exons E1/2 and E7, but have different candinals, pref. mice, having a mutated Ikaros transgene, esp.

Transgenic animals, pref. mice, having a mutated Ikaros transgene, esp.

Transgenic animals, pref. bNA bluding domain of the Ikaros protein, an experience a mutation that alters the DNA bluding domain of the ikaros protein, and a mutation is madels to determine the effects of treatments for immune

New nucleic acid encoding Ikaros protein involved in early new nucleic acid encoding Ikaros protein in several isoforms, and related products, used to treat e.g. immune diseases or cancer and related products, used to treat e.g. immune diseases or cancer and related products, used to treat e.g. immune diseases or cancer and claim 7: Page 68-70: 158pp; English.

This is the nucleotide of mouse Ikaros cDNA (isoform mIk-2) that codes for a 41-amino acid zinc finger protein (see W70963) that is involved in the early differentiation of lymphocytes. A CDNA library constructed from the mature murine T cell line E14 was screened with a multimerised oilgonucleotide (see W4289) derived contained the 1788 bp sequences that bind and mediate enhancer function. An isolated clone was designated likaros and contained the 1788 bp sequence. A 300 bp 3-terminal segment of this was used to identify 4 other Ikaros isoforms (see W42807-10). Different isoforms mik-2 lacks scorns is located at the proximal arm of murine chromosome 11. Ikaros gene is located at the proximal arm of murine chromosome 11. Ikaros gene is located at the proximal arm of murine chromosome 11. Ikaros gene is located at the proximal arm of murine chromosome 11. Ikaros proteins are suggested to play a role as a genetic switch regulating entry into the T cell lineage. The murine and human (see W42806, w12811 and w12840) ikaros sequences are very similar. The invention provides Raros nucleic acids, vectors and host cells expressing Ikaros proteins. These are used to treat T and B cell diseases (e.g. immune deficiencies caused by drugs, radiation or cancers), to control expression of heterologous creat nervous system diseases (e.g. immune deficiencies caused by drugs, radiation are annexed to inhibit interaction or differentiation or cancers), to control expression of the same effect can be achieved with Ikaros specially sequences. The same effect can be achieved with Ikaros special sequences of the same effect can be achieved with Ikaros special

Claim 7; Page 75-77; 158pp; English.

This is the nucleotide of mouse Ikaros CDNA (isoform mIk-1) that codes for a 518-maino acid zinc finger protein (see W10966) that is involved in the early differentiation of Iymphocytes. mIk-1 CDNA was isolated from a mature murine T cell line E14 library using a 100 bp fragment from the 3' end of mIk-2 CDNA (see V42805) as probe. 5 Different isoforms of mouse Ikaros (see V42805) as plicing of Ikaros gene transcripts. Isoform mIk-1 contains all 7 exons. It is abundantly expressed in the early foetal liver, the maturing thymus and the postnatal spleen. The Ikaros gene is coated at the proximal arm of murine chromosome 11. Ikaros proteins are suggested to play a role as a genetic switch regulating entry into the T cell lineage. The murine and human care usual to proteins are suggested to play a role as a genetic switch regulating entry into the T cell lineage. The murine and human care lives and v42806, v4281 and v42840 likaros sequences are very similar. The invention provides Ikaros nucleic acids, vectors and host cells expressing Ikaros proteins. These are used to treat T and B cell diseases (e.g. limmune deficiencies caused by drugs, radiation or cancers), to control expression of heterologous genes placed under control of an Ikaros-responsive element, to treat nervous system amplification or differentiation, especially in haematopoietic cells. Some Ikaros isoforms are antagonistic of others and may be used to inhibit interaction with DNA sequences. The same effect can be achieved with Ikaros-binding oligonucleotides. Examining the expression of the Ikaros gene, or its allelic structure, can be sequenced. States of acquiring the above diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ctacaagcagagaagctccctggaggagcacaaggaacgctgccgagcttttcttcagaa 1059

```
of the following properties: (a) it stimulates transcription of a DNA sequence under the control of a delta A element, an NFKB element or an Ikazos binding oilgonucleotide consensus sequence; (b) it binds to any of a delta A element, an NFKB element or an Ikazos binding oilgonucleotide consensus sequence; (c) it competitively inhibits the binding of a naturally occurring Ikazos sioform to any of a delta A element, an NFKB element or an Ikazos binding oilgonucleotide consensus sequence; (d) it competitively inhibits Ikazos binding to Ikazos responsive elements; or competitively inhibits protein interactions of transcriptional complexes formed with naturally occurring Ikazos isoforms. The proteins, provided that they stimulate gene transcription under the control of delta A elements and/or Ikazos-binding oilgonucleotides, competitively inhibit binding of naturally occurring Ikazos binding of competitively inhibit Ikazos binding of Ikazos-binding oilgonucleotides, competitively inhibit Ikazos binding of Ikazos-responsive elements and/or competitively inhibit Ikazos binding of Ikazos-responsive elements and/or competitively inhibit Ikazos binding of transcriptional complexes with naturally occurring Ikazos binding of transcriptional complexes with caturally occurring Ikazos binding of transcriptional complexes with caturally occurring Ikazos isoforms, can be used to treat immune system disorders, e.g. leakaemia or AIDS, or corpus striatum disorders, e.g. classaes. The present sequence encodes a specifically calamed mouse Ikazos protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1107
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1000 ctacaagcagagaagctccctggaggagcacaaggaacgctgccgagctttcttcagaa 1059

                                                                                                                                                                                                                                                                                Disclosure: Page 65-67; 102pp; English.

CDNA clones (T16059 and T16061-64) encode different isoforms, mix-2, mix-3, mix-1, mix-4 and mix-5 (R92014 and R92016-19), respectively), of the mouse Ikaros protein, a master regulator of hematopoietic differentiation. They were isolated from a mature 7-cell line E-14 CDNA library. The isoforms arise by differential Splicing of the Ikaros genomic locus. All include exons E1/2 and E7, but have different combinations of exons E3-E6 encoding a fine figured domain. Transgenic animals, pref. mice, having a mutated Ikaros transgene, esp. a mutation that alters the DNA binding domain of the Ikaros protein, are used as models to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   gggacaccttaggacacattctgtggagaagccgtacaagtgtgagttctgcggaagaag

differentiation of lymphocytes - existing in several isoforms, and related products, used to treat e.g. immune diseases or cancer and to control cell differentiation

Claim 1: Page 127-129: 158pp: English.

This is the nucleotide of human Ikaros cDNA (isoform hIk-1) that codes for a 516-amino acid zinc finger protein (see W10971) that is involved in the early differentiation of lymphocytes. It was isolated from a Jurkat T cell line library using mouse ikaros exon convolved in the early differentiation of lymphocytes. It was isolated from a Jurkat T cell line library using mouse ikaros exon chromosome 7. The human and murine ikaros sequences (see V42805-11 and V42840) are highly conserved. Differential splicing of Ikaros and V42840 provides Ikaros nucleic acids, vectors and host cells expressing Ikaros proteins. These are used to treat T and B cell diseases (e.g. immune deficiencies caused by drugs, radiation or ancers), to control expression of heterologous genes placed under control of an Ikaros responsive element, to treat nervous system diseases (e.g. Alzheimer's disease) and to modulate cell division, amplification or differentiation, especially in haematopoletic cells. Some Ikaros isoforms are antagonistic of others and may be used to inhibit interaction with DNA sequences. The same effect can be achieved with Ikaros-binding oligonucleotides. Examining the expression of the Ikaros gene, or its allelic structure, can be used to assess risk of acquiring the above diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ccggatgatggaccaagccatcaataacgccatcagctatctaggggctgaagccttccg 1332

This is the nucleotide of human Ikaros CDNA (isoform hIk-1) that codes for a 461-amino acid zinc finger protein (see W70964) that is involved in the early differentiation of lymphocytes. It was isolated from a Jurkat T cell line library using mouse Ikaros exon 7 cDNA as probe. The Ikaros gene maps between pll.2-pl3 on human and wuchnonsome 7. The human and murine Ikaros sequences (see 442805-11 and V42840) are highly conserved. Differential splicing of Ikaros

gene transcripts gives rise to different Ikaros protein isoforms.

If a invention provides Ikaros nucleic acids, vectors and host cells expressing Ikaros proteins. These are used to treat T and B cell diseases (e.g. immune deficiencies caused by drugs, radiation or cancers), to control expression of heterologous genes placed under control of an Ikaros-responsive element, to treat nervous system diseases (e.g. Alzheimer's disease) and to modulate cell division, emplification or differentiation, especially in haematopoietic cells. Some Ikaros isoforms are antagonistic of others and may be used to inhibit interaction with DNA sequences. The same effect can be achieved with Ikaros-binding oligonocleotides. Examining the expression of the Ikaros gene, or its allelic structure, can be used to assess risk of acquiring the above diseases.

Disclosure; Column 55-58; 111pp; English.

The present invention describes a purified peptide having at least one of the following properties: (a) it stimulates transcription of a DNA sequence under the control of a delta A element, an NFKB element or an itaros binding oligonucleotide consensus sequence; (b) it binds to any of a delta A element, an NFKB element or an itaros binding oligonucleotide consensus sequence; (c) it competitively inhibits the binding of a naturally occurring itaros isoform to any of a delta A element, an NFKB element or an itaros binding oligonucleotide consensus sequence; (d) it competitively inhibits faros binding oligonucleotide consensus sequence; (d) it competitively inhibits protein interactions of transcriptional complexes of the inhibits protein protein interactions of transcriptional complexes formed with naturally occurring itaros isoforms. The proteins, provided that they stimulate gene transcription under the control of delta A elements, NFKB elements and/or itaros-binding oligonucleotides, bind to delta A elements, NFKB elements and/or itaros-binding oligonucleotides,

competitively inhibit binding of naturally occurring Ikaros isoforms to delta A elements. NFKB elements and/or Ikaros binding oligonucleotides, competitively inhibit Ikaros binding to Ikaros responsive elements and/or inhibit protein-protein interactions of transcriptional complexes with naturally occurring Ikaros isoforms, can be used to treat immune system disorders, e.g. leukaemia or AIDS, or corpus striatum disorders, e.g. Alzheimer's disease. The present sequence encodes a specifically claimed human Ikaros protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1059
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1152

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
Disclosure; Fig 2; 102pp; English.

An almost full-length CDNA sequence (T16060) codes for part (R92015) of the human Ixaros protein, a master regulator of haematopoietic differentiation. It was isolated from a T-cell line Jurkat CDNA library using a mouse Ixaros CDNA clone as probe. The human Ixaros gene maps to pll.2-pll3 on chromosome 7.

Different isoforms (see R92014 and R92016-19) of mouse Ixaros have also been isolated. Transgenic animals, pref. mice, having a mutated Ixaros transgene, esp. a mutation that allers the DNA binding domain of the Ixaros protein, are used as models to determine the effects of treatments for immune or nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          820 gtgcggggcatcttttactcagaaaggtaacctcctccgtcatattaaactgcacacggg

                                                                                                                                committed lymphoid progenitors and in T and B cells, and is a transcriptional activator of a lymphoid gene. Aiolos cDNA can be used to produce recombinant Aiolos polypeptide (W15575) in host cells. The Aiolos polypeptide, coding sequence or cells expressing Aiolos may be used to treat a disorder in an animal, esp. by gene therapy. Such disorders include T-cell leuksemias and lymphomas. Non-wildtype gene structure or expression is indicative of a risk for such a disorder. Transgenic animals with an Aiolos transgene

                                                                                                                                                                                                  T-cell pathway regulatory gene, Ikaros - encodés family of unique zinc finger proteins, useful for treating immune system disorders claim 13; Page 44-46; 112pp; English.

The Ikaros gene encodes a zinc finger protein which can be used in therapeutic composition to treat animals with an immune system disorder. It may also be used for assessing whether a subject is risk for an immune disorder. It is of particular use in treating disorder of the corpus striatum.

Partial human Aiolos CDNA (T60491) was isolated by PCR amplification using primers (see also T60494-95) based on mouse Aiolos gene expression is restricted to lymphoid inneage. Aiolos polypeptide can form dimers with Aiolos or Ikaros polypeptides, is expressed in

Disclosure; Page 73-76. Hispp: English.

A cDNA clone (T6040) corresponds to the mouse Aiolos gene, a homologue of Ikaros whose expression is restricted to lymphoid commonly that spanned nucleotides 796-1156 of the sequence. Inneage. Aiolos CDNA was isolated from a mouse spleen CDNA library using a probe that spanned nucleotides 796-1156 of the sequence. Aiolos (W15574) can form dimers with Aiolos or Ikaros polypeptides, as expressed in committed lymphoid progenitors and in T and B cells, and is a transcriptional activator of a lymphoid gene. Primers of see also T6049-95) based on mouse Aiolos gene exons were used to amplify a human partial Aiolos CDNA (see also T60491). Aiolos CDNA can be used to produce recombinant Aiolos in transformed host cells. The Aiolos polypeptide, coding sequence or cells expressing Aiolos may be used to treat a disorder in an animal, esp. by gene therapy. Such disorders include T-cell lenkramias and lymphomas. Transgenic animals are provided with an Aiolos transgenic Sequence 1984 BP; 512 A; 570 C; 535 G; 357 T;
